

UTILIZE INSTRUMENTATION AND CONTROLS IN FACILITY AND ENERGY MANAGEMENT

Buildings should be planned according to the properly determined requirements and needs of the owners and users. The performance of a building can be verified only if the instrumentation is on adequate level and building automation system (BAS) gives relevant and reliable information. This requires a careful design, installation and implementation. Sensors must be installed in the right position and must be calibrated regularly.

Make sure that the instrumentation and control system is able to:

- give enough information for compliance assessment and verification
- monitor and evaluate key figures of indoor climate
- produce customized real-time reports for users
